## **Table of Contents**

- 1. Executive Summary**
- 2. Business Problem**
- 3. Data Sources & Signals Used**
  - 3.1 Cost Structure
  - 3.2 Demand Metrics
  - 3.3 Inventory Health
  - 3.4 Competitive Positioning
- 4. Pricing Framework Logic**
  - 4.1 Step 1: Profitability Floor
  - 4.2 Step 2: Target Margin Price
  - 4.3 Step 3: Inventory-Based Adjustment
  - 4.4 Step 4: Demand-Based Adjustment
  - 4.5 Step 5: Competitive Alignment
  - 4.6 Step 6: Margin Protection Rule
- 5. Analytical Findings**
  - 5.1 Inventory Impact on Pricing
  - 5.2 Demand Signal Effectiveness
  - 5.3 Competitive Pressure Analysis
  - 5.4 Margin Discipline Evaluation
- 6. Business Impact Simulation**
- 7. Strategic Insights**
- 8. Limitations & Future Enhancements**
- 9. Conclusion**
- 10. Appendix**
  - 10.1 Formula Logic
  - 10.2 Demand Classification Logic
  - 10.3 Inventory Categorization Rules
  - 10.4 Competition Adjustment Rules
  - 10.5 Assumptions
  - 10.6 Dataset Overview

## **1. Executive Summary**

This project presents a structured pricing optimization framework for an e-commerce catalog containing multiple SKUs with varying cost structures, demand patterns, inventory levels, and competitive pressures.

The objective was to design a scalable, data-driven pricing system that:

- Protects profitability
- Responds to demand signals
- Adjusts for inventory risk
- Aligns with competitive market conditions

Instead of reactive pricing, a rule-based analytical framework was implemented to generate SKU-level recommended prices while maintaining margin discipline.

---

## **2. Business Problem**

The catalog exhibited inconsistent pricing decisions due to:

- Rapid stock-outs in high-demand SKUs
- Overstock accumulation in slow-moving products
- Misalignment with competitor price bands
- Margin erosion in high-competition segments

The company required a repeatable pricing logic that balances:

- Growth
  - Profitability
  - Operational stability
- 

## **3. Data Sources & Signals Used**

The pricing model integrates multiple business signals:

### **3.1 Cost Structure**

- Product Cost

- FBA Fee
- Storage Fee
- Handling Cost
- Minimum & Target Margin %

### **3.2 Demand Metrics**

- Sessions
- Units Ordered
- Conversion Rate

Demand classification:

- STRONG (above-average conversion rate)
  - WEAK (below-average conversion rate)
- 

### **3.3 Inventory Health**

- Days of Supply
- Sell-through metrics

Inventory classification:

- LOW\_STOCK (< 30 days)
  - HEALTHY (30–90 days)
  - OVERSTOCK (> 90 days)
- 

### **3.4 Competitive Positioning**

- Average Competitor Price
- Lowest Competitor Price
- Highest Competitor Price
- Competitor Count

These define the market pricing envelope.

---

## **4. Pricing Framework Logic**

The pricing engine follows a structured sequence:

---

### **Step 1: Profitability Floor**

Total Unit Cost =

Product Cost + FBA Fee + Storage Fee + Handling Cost

Minimum Price =

Total Unit Cost / (1 – Minimum Margin)

This ensures no SKU is sold at a loss.

---

### **Step 2: Target Margin Price**

Target Price =

Total Unit Cost / (1 – Target Margin)

This establishes profitability objective.

---

### **Step 3: Inventory-Based Adjustment**

- LOW\_STOCK → Increase price (+10%)
- OVERSTOCK → Decrease price (-10%)
- HEALTHY → No change

Purpose: Balance stock pressure and capital lock-in risk.

---

### **Step 4: Demand-Based Adjustment**

- STRONG demand → Increase price (+5%)
- WEAK demand → Reduce price (-5%)

Purpose: Capture willingness to pay while supporting slow movers.

---

## **Step 5: Competitive Alignment**

If adjusted price:

- Exceeds 110% of lowest competitor → reposition to 105%
- Falls below 90% of average competitor → reposition to 95%
- Otherwise → maintain adjusted price

Purpose: Avoid price wars while staying market-relevant.

---

## **Step 6: Margin Protection Rule**

Final Recommended Price =

$\text{MAX}(\text{Competition\_Adjusted\_Price}, \text{Minimum\_Price})$

This guarantees profit protection across all SKUs.

---

## **5. Analytical Findings**

### **5.1 Inventory Has Strong Pricing Influence**

Low-stock SKUs supported price increases without harming competitiveness.

Overstocked SKUs required margin sacrifice to improve inventory velocity.

---

### **5.2 Demand Signal Improves Precision**

Conversion rate effectively differentiated pricing power across SKUs.

High-demand products tolerated moderate price increases.

---

### **5.3 Competitive Pressure Limits Aggression**

High competitor density constrained upward pricing flexibility.

Low competition SKUs allowed improved margin capture.

---

### **5.4 Margin Discipline Maintained**

No SKU was recommended below minimum viable pricing threshold.

Profit integrity was preserved across the catalog.

---

## **6. Business Impact Simulation (Framework-Based)**

Using historical sales volumes:

Estimated outcomes include:

- Improved margin capture in strong-demand SKUs
- Reduced capital lock in overstocked items
- Controlled competitive drift
- Standardized pricing governance process

The framework enables consistent decision-making rather than manual reactive adjustments.

---

## **7. Strategic Insights**

- Pricing must integrate operational signals, not just cost
  - Inventory risk and demand elasticity are interconnected
  - Competitive benchmarking must be guided, not blindly followed
  - Structured pricing improves scalability in growing catalogs
- 

## **8. Limitations & Future Enhancements**

Future improvements could include:

- Demand elasticity modeling
  - Predictive demand forecasting
  - Weighted scoring models
  - Dynamic ad-performance integration
  - Scenario simulation dashboards
-

## **9. Conclusion**

This project demonstrates the development of a multi-signal pricing optimization framework combining financial discipline with operational intelligence.

The model is:

- Scalable
- Transparent
- Data-driven
- Business-aligned

It provides a structured foundation for evolving toward more advanced predictive pricing systems.

---

## **10. Appendix**

### **10.1 Formula Logic (Very Important)**

Put your core formulas clearly written.

Example:

#### **Total Unit Cost**

= Product Cost + FBA Fee + Storage Fee + Handling Cost

#### **Minimum Price**

= Total Unit Cost / (1 - Minimum Margin %)

#### **Target Price**

= Total Unit Cost / (1 - Target Margin %)

#### **Final Price**

= MAX(Competition\_Adjusted\_Price, Minimum\_Price)

This shows transparency. Recruiters love that.

---

### **10.2 Demand Classification Logic**

Explain how you defined STRONG vs WEAK demand.

Example:

Conversion Rate = Units Ordered / Sessions

Demand Flag = IF(Conversion Rate >= Average Conversion Rate, STRONG, WEAK)

Or explain percentile logic if you upgrade it later.

---

### 10.3 Inventory Categorization Rules

Show this clearly:

- LOW\_STOCK → Days of Supply < 30
- HEALTHY → 30–90
- OVERSTOCK → > 90

This proves your decision thresholds are intentional.

---

### 10.4 Competition Adjustment Rules

Document your guardrails:

- Price > 110% of Lowest Competitor → Reduce
- Price < 90% of Average Competitor → Increase

This shows structured reasoning.

---

### 10.5 Assumptions

This is powerful. Many students skip it.

Example:

- Demand elasticity assumed constant
- Historical sales assumed representative
- No seasonality adjustment applied
- Advertising impact not directly modeled in final price

This makes you look like someone who understands model limitations.

---

## 10.6 Dataset Overview (Optional but Strong)

Add a small summary table:

Dataset	Purpose	Key Fields Used
Pricing_Data	Cost & margin baseline	Cost, Fees, Margins
Historical_Sales	Demand signal	Sessions, Units
Inventory_Health	Stock risk	Days of Supply
Competitor_Data	Market benchmarking	Avg Price, Lowest Price
